

Analysis of 3rd-party Data Sharing and Data Tracking and of GDPR Compliance of Norwegian Web Sites

Humna Akhtar, Mithun Chandra Debnath, Karina Sætersdal Nilssen, and Sumit Prasad Sah

Department of Computer Science, Oslo Metropolitan University

ACIT4280 Privacy by Design

Group Assignment 1A

3 September 2026

Introduction

What this report is about

This report answers two questions about Norwegian-facing web sites. First: when a person opens the front page, how much of that page talks to other companies, and in which countries do those other machines appear to sit? Second: when a site uses personal data, has it named a lawful reason under the GDPR,¹ and does that reason hold when we test it with an official guidance tool? The two questions are not the same. A newspaper can load many advertising scripts and still have a legal reason to keep a subscriber account. A tax office can have a strong legal reason to hold income data and still fail a consent test for optional statistics cookies. Part 1 measures contact. Part 2 tests lawfulness for one purpose at a time.

The course list has 18 sites (Table 1). We scanned all 18 with Webbkoll.² From those 18 we chose five sites (Table 1a) and tested one concrete activity on each with the ICO lawful basis tool.³ The numbers are in Tables 2 and 3. The pictures by sector are Figures 3 to 5. The ICO comparison is Table 5.

What the main words mean

Personal data is information that can identify a person, such as a name, an email address, or an online identifier (General Data Protection Regulation, 2016). The GDPR is the main EU/EEA law for that information. Norway is in the EEA, so the GDPR applies here. *Processing* means collecting, storing, showing or sending that information. It is lawful only if at least one Article 6 basis fits the purpose

(General Data Protection Regulation, 2016, art. 6). The bases used here are legal obligation (the law requires it), public task (a public body doing its job), contract (needed to deliver what the person asked for), consent (a free, informed Yes), and legitimate interests (a real organisational need that does not override the person).

A *cookie* is a small file stored on the device. An *internal* (first-party) cookie is set by the site the person opened. An *external* (third-party) cookie is set by someone else, for example an advertiser. Separate EU rules also cover storing or reading information on a device (Cookie Directive, 2009; ePrivacy Directive, 2002).⁴ That is why a Yes/No banner can be required for analytics cookies even when tax data rest on law, not on consent.

A *third-party request* is a network call from the open page to another host, such as fonts, ads, or a video player.⁵ That is not the same as a third-party cookie. A page can call many other hosts and still set zero third-party cookies.

The assignment's cookie columns are not about whether someone clicked Accept. They are a count of cookie files found after one load, with the banner left untouched. Figure 1 splits that file, the third-party call, and the banner. We rank the 18 sites on the call (requests), not on the banner.

Figure 1

Cookie File, Third-Party Call, and Accept Banner

Three different questions (only the first two are the Webbkoll ranking)

A. The cookie file · Part 1

A small file on the device

Internal cookie: set by the site you opened (for example xxl.no).

External cookie: set by someone else (for example an advertiser).

Webbkoll counts these files after one page load. It does not click Accept or Reject.

17 of 18 sites had 0 external cookies. ikea.no had 2.

This is the cookie column in Table 2.

B. The third-party call · Part 1

The page talks to other hosts

A request is a network call to another machine (ads, fonts, video).

That call can happen even when NO third-party cookie is set.

fotball.no: 113 requests and still 0 external cookies.

This is what we rank as 'worst sharer', not the Accept button.

This is the request column in Table 2.

C. The Accept banner · not the ranking

Yes / No on a pop-up

A banner asks: may we store or read info on this device?

That is an ePrivacy question. It is not GDPR Article 6.

We did not click Accept for the 18-site table.

One extra ICO run (skatteetaten optional stats cookies) tests the notice, not Table 2.

Not how Table 2 / Table 4 are ranked.

Article 6 is a fourth question: why may we use this personal data (tax file, paid account, checkout)? That is Part 2. It is not the Accept click.

Note. Compiled by the authors. Panels A and B are what Webbkoll records for Table 2. Panel C is the pop-up. We did not click Accept for the 18-site ranking. Article 6 (why personal data may be used) is Part 2 and is not the Accept click.

Table 1

Course Web Site List Analysed with Webbkoll

Sector (as on Canvas)	Services
Shopping	xxl.no, cdon.no, ikea.no, babyshop.no
Government	skatteetaten.no, barnevernet.no, altinn.no, lanekassen.no
News & media & entertainment	aftenposten.no, nrk.no, netflix.no, document.no, klassekampen.no, spotify.no, worldofwarcraft.com
Spare time / sports	dnt.no, fotball.no, skiforeningen.no

Note. These are the 18 names on the course list. We typed each name into Webbkoll as written. Some names redirect (ikea.no opens as ikea.com). We still report the course name. document.no is on the list with a content warning; we include it because it is on the list, not as a source of facts.

Table 1a

Five Services Chosen from Table 1 for the ICO Lawful Basis Tool

Service	Sector	Why this site
babyshop.no	Shopping	Retail checkout; high request count on the repeat scan
skatteetaten.no	Government	Public authority; tax and cookies as two purposes
netflix.no	News & media & entertainment	Paid subscription (contract)
document.no	News & media & entertainment	Widest country list; advertising analytics

Service	Sector	Why this site
fotball.no	Spare time / sports	Highest third-party request count in Table 2

Note. We took one shopping site, one government site, two news/media/entertainment sites, and one spare time / sports site. The ICO answers are Table 5. "Why this site" is the reason we picked it for Part 2, not a Webbkoll score.

Part 1: How much does each site contact others?

What Webbkoll is

Webbkoll is a free public scanner (5th of July Foundation, n.d.-c). A person types a web address. The tool then opens that page in a clean Chromium browser⁶ and writes a report: HTTPS,⁷ cookies, third-party requests, and the server IP⁸ (5th of July Foundation, n.d.-a, n.d.-b). Figure 2 shows the start page.

Webbkoll does not read the privacy notice. It does not click Yes or No on a cookie banner. It does not decide whether Article 6 is met. It only shows what that one page load contacted.

How we ran the scans

We used the English Webbkoll interface on every service in Table 1. Each result is one live visit with no add-ons, no Do Not Track,⁹ and no consent click. We copied the scan clock from the result page. We did this twice on 20 August 2026 so we could see whether a later visit looked different. Webbkoll can keep a result for about 24 hours, so two clocks on the same day can still differ. Table 2 is the first visit. We use Table 2 for all rankings. Table 3 is the later visit. We do not average the two tables.

What KeyCDN is, and what a country cell means

KeyCDN IP Location Finder is a look-up page: we paste an IP address, and it returns a likely country and company name (KeyCDN, n.d.).¹⁰ We used it in two ways. For "location of server" we looked up the site's own IP. For "list of countries" we looked up the IPs of the other hosts that Webbkoll listed. We then counted unique countries after dropping Norway, because the assignment asks for countries excluding Norway. If KeyCDN returned no country, we wrote n/a.

A country on that list means: this is where the contacted host appeared to sit at look-up time. It is a map of machines, not a legal file of personal-data exports. GDPR Chapter V sets extra rules when personal

data are sent outside the EEA (General Data Protection Regulation, 2016, art. 44-47).¹¹ Our KeyCDN list does not prove that such a transfer happened, and it does not prove that it did not happen.

What each Webbkoll column means

Read Table 2 from left to right as one homepage load. Internal cookies: files set by the site itself. External cookies: files set by other parties. Third-party requests: how many times the page called another host. Countries excl. Norway: how many different countries those other hosts mapped to, after dropping Norway. The country list can still print NO if Norway appeared in the raw look-up; the count column already excludes it.

Figure 2
Webbkoll Start Page for klassekampen.no

Note. From Webbkoll [Screenshot], by 5th of July Foundation, n.d.-c (<https://webbkoll.dataskydd.net/en>). klassekampen.no is fifth-highest on third-party requests in Table 2 and is therefore used as the method example.

What Table 2 and Table 3 show

Table 2 is the first scan of all 18 sites on 20 August 2026. Use it with Figures 3 to 5. Table 3 is the same 18 sites later that day, with third-party countries looked up on 21 August 2026. Treat Table 3 as a check: a later visit can change. Do not treat it as a second ranking, and do not average it with Table 2.

What the pictures show

Figure 3 is a bar for each site. Longer bar means more third-party requests on the first scan. Figure 4 is the same numbers as slices of a pie, so a reader can see who takes a large share of the total. Figure 5 adds the bars by course sector. News, media and entertainment contact the most hosts in total. Government contacts the fewest. Spare time / sports looks high because fotball.no is very high. Shopping sits between those extremes.

Seventeen of the 18 sites set zero third-party cookies on that first load. The exception is ikea.no (two external cookies) after the redirect to ikea.com. Request counts in Table 2 run from 1 (lanekassen.no) to 113 (fotball.no). On the later visit, babyshop.no jumps to 101 requests (Table 3). That jump is why we keep rankings on Table 2. A high request count is still not a cookie count, and it is still not a finding that personal data left Norway (General Data Protection Regulation, 2016, art. 44-47).

Table 2

Webbkoll Results for the 18 Services in Table 1 (First Measurement, 20 August 2026)

Name of service	Sector	Location of server	Internal cookies	External cookies	3rd-party requests	Countries excl. Norway	List of countries
xxl.no	Shopping	US	3	0	26	4	PL, IE, CA, SE
cdon.no	Shopping	CA	4	0	33	3	CA, US, SE
ikea.no	Shopping	CA	8	2	15	2	CA, US
babyshop.no	Shopping	CA	1	0	45	2	SE, US
skatteetaten.no	Government	CA	5	0	14	5	IE, SE, FR, GB, NO, CA
barnevernet.no	Government	NO	2	0	25	4	SE, DE, CA, NO, GB
altinn.no	Government	CA	0	0	5	1	US
lanekassen.no	Government	NL	0	0	1	1	DE
aftenposten.no	News, media & entertainment	SE	5	0	48	5	SE, CA, US, DE, IE
nrk.no	News, media & entertainment	SE	10	0	7	1	SE
netflix.no	News, media & entertainment	GB	6	0	22	2	GB, CA
document.no	News, media & entertainment	DE	4	0	51	6	US, CA, SE, FR, DE, FI
klassekampen.no	News, media & entertainment	US	4	0	46	2	SE, US

Name of service	Sector	Location of server	Internal cookies	External cookies	3rd-party requests	Countries excl. Norway	List of countries
spotify.no	News, media & entertainment	US	3	0	10	2	SE, US
worldofwarcraft.com	News, media & entertainment	IE	4	0	90	4	FR, SE, CA, US
dnt.no	Spare time / sports	GB	6	0	16	4	SE, CA, NL, FI
fotball.no	Spare time / sports	NL	8	0	113	5	SE, DK, CA, US, NL
skiforeningen.no	Spare time / sports	SE	1	0	14	3	NL, US, SE

Note. These are the assignment columns, plus sector so Figure 5 can be read against Table 1. "Location of server" is KeyCDN of the site's own IP. "3rd-party requests" is other hosts contacted on that load. The country list may still show NO; the count column already excludes Norway. We keep the course name even when Webbkoll followed a redirect.

Table 3

Repeat Webbkoll Measurement (20 August 2026) and KeyCDN Third-Party Countries (21 August 2026)

Name of service	Sector	Location of server	Internal cookies	External cookies	3rd-party requests	Countries excl. Norway	List of countries
xxl.no	Shopping	US	3	0	26	2	IE, US
cdon.no	Shopping	US	4	0	33	1	US
ikea.no	Shopping	US	8	2	15	1	US
babyshop.no	Shopping	n/a	1	0	101	2	IE, US
skatteetaten.no	Government	US	5	0	14	4	FR, IE, SE, US
barnevernet.no	Government	NO	2	0	25	4	DE, IE, SE, US
altinn.no	Government	n/a	0	0	5	1	US
lanekassen.no	Government	NL	0	0	1	1	DE
aftenposten.no	News, media & entertainment	US	5	0	49	4	DE, IE, SE, US
nrk.no	News, media & entertainment	SE	11	0	7	1	SE
netflix.no	News, media & entertainment	US	6	0	22	1	US
document.no	News, media & entertainment	DE	4	0	51	5	FI, FR, IE, SE, US
klassekampen.no	News, media & entertainment	US	4	0	56	3	IE, SE, US
spotify.no	News, media & entertainment	US	3	0	10	2	SE, US

Name of service	Sector	Location of server	Internal cookies	External cookies	3rd-party requests	Countries excl. Norway	List of countries
worldofwarcraft.com	News, media & entertainment	IE	4	0	92	3	IE, SE, US
dnt.no	Spare time / sports	n/a	6	0	16	5	FI, IE, NL, SE, US
fotball.no	Spare time / sports	NL	9	0	114	5	DK, IE, NL, SE, US
skiforeningen.no	Spare time / sports	US	1	0	14	3	IE, NL, US

Note. This is a later visit, not a new ranking. babyshop.no is 101 here and 45 in Table 2. klassekampen.no is 56 here and 46 in Table 2. n/a means KeyCDN gave no country for the server IP (dnt.no, babyshop.no, altinn.no). Redirects were measured at the landing host.

Figure 3

Third-Party Requests for 18 Sites (Table 2)

Note. Compiled by the authors from Webbkoll results. Ranked on the Table 2 request column. Highest five start at fotball.no (113). Lowest five start at lanekassen.no (1).

Figure 4

Share of Third-Party Requests (Table 2)

Note. Compiled by the authors from Webbkoll results. fotball.no and worldofwarcraft.com together account for about one third of all recorded requests.

Figure 5

Third-Party Requests by Sector (Table 2)

Note. Compiled by the authors from Webbkoll results. Sector totals follow Table 2. News and media carry the most requests; government carries the fewest.

Highest contact, most countries, and restrained e-government

The assignment asks which sites are interesting: who shares the most, who looks most global, and which e-government site looks most restrained. We rank on third-party requests in Table 2 (Figure 3), not on the cookie column, because almost every site had zero external cookies.

On that measure, fotball.no is the highest (113 requests) and still has zero third-party cookies. document.no has the widest first country list (six countries excluding Norway). lanekassen.no (1 request) and altinn.no (5) are the most restrained government fronts. Table 4 lists the highest five and the lowest five. A site can be "quiet" on cookies and still "loud" on requests. If we had ranked Table 3, babyshop.no would sit near the top at 101. We do not do that. Rankings stay on the first scan.

Table 4

Highest Five and Lowest Five by Third-Party Request Volume (Table 2)

Rank	Name of service	Sector	Req.	n countries
Highest 1	fotball.no	Spare time / sports	113	5
Highest 2	worldofwarcraft.com	News, media & entertainment	90	4
Highest 3	document.no	News, media & entertainment	51	6
Highest 4	aftenposten.no	News, media & entertainment	48	5
Highest 5	klassekampen.no	News, media & entertainment	46	2
Lowest 5	skiforeningen.no	Spare time / sports	14	3
Lowest 4	spotify.no	News, media & entertainment	10	2
Lowest 3	nrk.no	News, media & entertainment	7	1
Lowest 2	altinn.no	Government	5	1
Lowest 1	lanekassen.no	Government	1	1

Note. Ranked on Table 2 requests. Highest 1 means most third-party requests. Lowest 1 means fewest. skatteetaten.no also has 14 requests; skiforeningen.no is listed because it maps to fewer countries (3 vs 5). document.no has the widest first country list (6). ikea.no is still the only site with third-party cookies (2).

One full example: klassekampen.no

Figures 2, 6 and 7 show one site from start page to IP look-up, so a reader can see how a Table 2 row is built. klassekampen.no is fifth-highest in Table 4 because the first scan recorded 46 requests. The screenshots are the later visit the same day. On that later visit Webbkoll counted four first-party cookies,

zero third-party cookies, and 56 requests to 13 hosts (Table 3). Those hosts included Google advertising, Meta, and Cookiebot.¹²

Webbkoll also flags missing security headers such as HSTS and CSP.¹³ Those flags concern integrity and confidentiality (General Data Protection Regulation, 2016, art. 5(1)(f), 25, 32). They do not tell us the Article 6 basis. Privacy by design is both layers: how the page behaves, and why the controller may process the data. The KeyCDN look-up of the server IP is United States, Google (Figure 7). That is a location of a machine, not a Chapter V transfer record.

Part 2: Does the site have a lawful reason for this use of data?

What the ICO tool is

The Information Commissioner's Office (ICO) is the UK data protection authority. It publishes a step-by-step tool that asks about one processing activity and then marks which Article 6 bases look APPROPRIATE (Information Commissioner's Office, 2026).¹⁴ We used the official Word report from that tool (dated 26 August 2026), not a screenshot of the questions. A controller must name a purpose first, then a basis for that purpose (Information Commissioner's Office, n.d.). A web site does not have one basis for everything it does. Tax data, optional cookies and a shop checkout are different purposes. Mix them in one run, and the tool mixes the answers. Each row in Table 5 is one purpose on one site from Table 1a. The tool is UK guidance used because the assignment asks for it. It does not replace a full audit.

Why a cookie banner is not Article 6

Article 6 answers: why may we use this personal data? Cookie and ePrivacy rules answer a different question: may we store or read information on this device (ePrivacy Directive, 2002)? Figure 1, panel C, is that banner. A Yes/No banner can be the right test for optional analytics cookies. It is the wrong test for a tax file that the law requires the Tax Administration to keep. If we put tax and cookies in one ICO run, the tool will pick the wrong basis. It is also not how we ranked the 18 sites in Part 1.

skatteetaten.no: tax data versus optional cookies

The Tax Administration notice says that processing of identity, income and tax data is required by law and is generally not optional (Norwegian Tax Administration, n.d.-a). The ICO report marks legal obligation and public task APPROPRIATE. Consent is NOT APPROPRIATE and likely invalid, because a person cannot give a genuine, free, ongoing No to a statutory duty.

Optional statistics cookies (Skyra, Matomo, Google Analytics, Siteimprove) are a different purpose. They use a Yes/No banner. A second ICO run marks consent INCONCLUSIVE: there is a choice, but the

request does not fully name controller, purpose and types. No basis is APPROPRIATE for that cookie purpose. Table 5 therefore has two rows for the same site.

Webbkoll never clicks the banner (5th of July Foundation, n.d.-b). That is why Table 2 shows five internal cookies and zero external cookies for skatteetaten.no even though the notice still offers optional statistics cookies. The ICO cookie row tests the notice, not the Webbkoll count. On 24 August 2026 we opened skatteetaten.no/person/ in a clean browser and selected No. That only tests whether optional tracking is blocked after rejection. It is not the lawful basis for tax administration. Figure 8 shows the hub that already splits "privacy notice" and "cookies", which is the same split as Table 5.

Figure 8
Security and Privacy Hub on skatteetaten.no

Note. From the Tax Administration security and privacy hub [Screenshot], by Norwegian Tax Administration, n.d.-b (<https://www.skatteetaten.no/en/about-the-norwegian-tax-administration/security-and-privacy/>). Personvernerklæring and Informasjonskapsler are listed as separate destinations. The two ICO rows for skatteetaten.no follow that split.

netflix.no: paid streaming

The purpose is account and payment data needed to provide the paid subscription (Netflix, 2026). Contractual necessity means the processing is needed to perform the agreement, not merely useful for the company. ICO marks contract APPROPRIATE. Consent is likely invalid: there is no real, ongoing choice if the film cannot be delivered without the account. Ads, recommendations and marketing in the same notice are other purposes and were kept out of this run.

fotball.no: name and club on the match list

Norges Fotballforbund publishes name and club of active players aged 13+ as match history, with opt-out through the club (Norges Fotballforbund, n.d.). ICO marks legitimate interests APPROPRIATE after a necessity and balancing check. NFF is a sports federation, not a public authority, so public task is not the fit. Membership in the FIKS system may rest on contract.¹⁵ Cookiebot may rest on ePrivacy consent. Those are other purposes. A "samtykke" tick in club software is not automatically valid GDPR consent if the person has no real choice.

document.no: Google Signals

This is the case that fails the consent test. Google Signals is described as advertising analytics.¹⁶ Article 6 is not named (Document Media AS, n.d.). Collection is said to run only with a Google login and ad personalization. That looks like consent. ICO marks no basis APPROPRIATE. Consent is INCONCLUSIVE because a valid request must be clear, prominent, and separate from other terms. The real choice sits in Google settings, and Document Pluss terms also bundle acceptance of the notice. Contract and legitimate interests are not a fit for this advertising purpose. Table 5 marks the row Partial.

babyshop.no: checkout

The purpose is name, address, contact, order and payment data needed to deliver goods. The sales terms are a purchase contract (Babyshop Sthlm Holding AB, n.d.). ICO marks contract APPROPRIATE. The notice does not label Article 6(1)(b), but the activity is still checkout. Marketing and cookies stay separate. A bundled "I agree to cookies" inside the terms is not valid Article 6 consent.

How to read Table 5

Table 5 puts the five ICO runs next to what the privacy notice says. Each row is one purpose. Yes means the notice and the ICO mark line up for that purpose. Partial means the notice aims at consent, but the official report marks consent INCONCLUSIVE and no basis APPROPRIATE.

Table 5

ICO Lawful Basis Summary for Five Selected Services

Service	Processing purpose (one)	Basis claimed in notice	ICO result	Match?
skatteetaten.no	Tax and registry administration (identity, income, tax data)	Legal obligation / processing required by law; opt-out generally not possible	Legal obligation and public task APPROPRIATE; consent NOT APPROPRIATE (likely invalid)	Yes
skatteetaten.no	Optional web statistics cookies	Consent (Yes/No banner)	Consent INCONCLUSIVE; no basis APPROPRIATE	Partial (separate run)
netflix.no	Account and payment data to provide paid streaming	EEA/UK: contractual necessity to provide the service to members	Contract APPROPRIATE; other bases NOT APPROPRIATE	Yes
fotball.no	Publishing player name and club for match history (13+)	Public-interest match history with club opt-out (LI in practice)	Legitimate interests APPROPRIATE; other bases NOT APPROPRIATE	Yes for this purpose
document.no	Google Signals / advertising analytics from site activity	Article 6 not named; Google login plus ad personalization; opt-out links	Consent INCONCLUSIVE; no basis APPROPRIATE	Partial
babyshop.no	Customer, delivery and payment data to complete a purchase	Not labeled as Article 6(1)(b); purchase data processed to fulfil orders	Contract APPROPRIATE; other bases NOT APPROPRIATE	Yes for checkout

Note. Official ICO reports dated 26 August 2026 (Information Commissioner's Office, 2026). Marketing, extra cookies and membership stay off this table unless they were the purpose of that run.

Conclusion

Part 1 asked how much each of the 18 course sites contacts other hosts. Webbkoll shows that contact. fotball.no has the most third-party requests (113) and still sets no third-party cookies. document.no maps to the most countries. lanekassen.no and altinn.no are the quietest government fronts. News and media contact the most hosts as a sector. Government contacts the fewest.

Part 2 asked whether five chosen sites have a named, workable Article 6 basis for one purpose each. Four core purposes match the notice (tax, Netflix streaming, football match lists, babyshop checkout). Two consent tests fail: optional cookies on skatteetaten.no and Google Signals on document.no. A legal duty to assess tax is not a cookie click. One purpose needs one basis.

This is one week's snapshot, not a year of traffic. KeyCDN countries show where machines appeared to sit. They are not a GDPR Chapter V transfer record (General Data Protection Regulation, 2016, art. 44-47). A later week on the same 18 URLs, and one extra purpose per ICO site, would test whether the picture holds.

Footnotes

- ¹ GDPR is the General Data Protection Regulation, the main EU law on personal data. It also applies in Norway through the EEA. Article 6 lists the allowed reasons for using personal data (legal obligation, public task, contract, consent, legitimate interests, vital interests). [^]
- ² Webbkoll is a free web site checker run by the Swedish 5th of July Foundation. You type a URL. It opens that page once and reports cookies, other hosts contacted, HTTPS and some security headers. It does not log in, and it does not click cookie banners. [^]
- ³ ICO is the Information Commissioner's Office, the UK data protection authority. The "lawful basis interactive guidance tool" is a questionnaire on the ICO web site. After the questions it produces a Word report that marks each Article 6 basis APPROPRIATE, NOT APPROPRIATE or INCONCLUSIVE. We used that Word file as the official result. [^]
- ⁴ The ePrivacy Directive (and the later Cookie Directive) is EU law about privacy in electronic communications. It is separate from GDPR Article 6. In short: storing or reading information on a phone or computer (cookies, similar tech) often needs consent, unless the storage is strictly necessary to provide the service the person asked for. [^]
- ⁵ A host is a machine with a name on the internet, such as fonts.googleapis.com. A third-party request means the open page asked that other machine for something (a script, an image, an ad). Counting requests is not the same as counting cookies, and it is not the same as proving that a name or a tax file was sent. [^]
- ⁶ Chromium is the open-source browser engine behind Google Chrome. Webbkoll uses a clean Chromium session so the scan is close to a first visit with no extra extensions. [^]
- ⁷ HTTPS is the encrypted version of web traffic (the padlock in the browser). HTTP without the S is the unencrypted version. Webbkoll checks whether the site forces HTTPS. [^]
- ⁸ An IP address is a number that identifies a machine on the internet, for example 192.0.2.1 or an IPv6 string such as 2600:1901:0:25b9:: Webbkoll prints the IP of the site it reached. We then paste that number into KeyCDN (see footnote 10). [^]
- ⁹ Do Not Track (DNT) is an old browser setting that asked sites not to track the user. Many sites ignore it. We left it off so the scan matches a default browser, as Webbkoll's FAQ describes. [^]
- ¹⁰ KeyCDN is a commercial content-delivery company. It also offers a free "IP Location Finder" at tools.keycdn.com/geo. You paste an IP address. The page returns a likely country, city and provider (for example Google LLC, United States). That answer is a geolocation guess. It can be wrong when the IP belongs to a cloud, a VPN or an anycast network. We used it because the assignment asks for server location and for countries of third-party hosts. It is not a government register of data exports. [^]
- ¹¹ GDPR Chapter V (Articles 44-47) is the chapter on transfers of personal data out of the EEA. Extra safeguards can be required (for example an adequacy decision or standard contractual clauses). Seeing "US" next to an IP in KeyCDN is not, by itself, proof that personal data were transferred under Chapter V. [^]
- ¹² Cookiebot is a common consent-management product. It shows a cookie banner and can block some scripts until the person clicks Yes or No. Webbkoll does not click that banner, so Cookiebot may still appear as a third-party host even when optional cookies are not set. [^]
- ¹³ HSTS (HTTP Strict Transport Security) tells the browser to use HTTPS only. CSP (Content Security Policy) tells the browser which scripts and hosts the page may load. They are technical security headers. Missing them is a robustness issue. It does not decide the lawful basis under Article 6. [^]
- ¹⁴ In the ICO Word report, APPROPRIATE means that basis can work for the purpose you described. NOT APPROPRIATE means it should not be used. INCONCLUSIVE means the facts you entered were not enough for a Yes (often the consent request is unclear). Those labels are guidance, not a court judgment. [^]
- ¹⁵ FIKS is Norges Fotballforbund's club and player administration system. A membership or licence in FIKS can rest on a contract with the club. Publishing a name on a public match list is a different activity, so it can have a different Article 6

basis. ^

¹⁶ Google Signals is a Google Analytics feature. When a visitor is logged into Google with ads personalization on, Google can join activity across devices and add demographic and interest reports. That is advertising analytics, not the same as a newspaper subscription contract. ^
