

ACIT4280 Privacy by Design - group submission overview

Internal guide for the group. Deadline 3 September 2026, 08:00. 40 points.

What we did in one sentence: We measured how much 18 Norwegian sites contact other companies when they load (Webbkoll), and we checked whether five of them have a valid GDPR reason for one specific use of personal data (ICO tool).

What we deliver to Canvas: English report (1000-1500 words plus diagrams) and a 20-minute presentation (17 slides).

1. The two research questions

These questions sit on the title slide, in the report introduction, and in the presentation close:

1. When a person opens a Norwegian-facing front page, how many other companies does that page contact, and in which countries do those machines appear to sit?
2. When a site uses personal data, has it named a GDPR Article 6 basis, and does that basis hold in the ICO tool?

Contact and lawfulness are different questions. A site can load many ad scripts and still have a lawful contract for checkout.

2. What the assignment asks for

Part 1 - Webbkoll (18 sites)

- Table with server country, cookies, third-party requests and countries
- Charts per sector
- Who contacts the most, who looks most global, quietest e-government site

Part 2 - ICO (5 sites, group 1-A)

- Read the privacy notice
- Run the ICO tool on **one purpose at a time**
- Compare notice vs ICO result in Table 5

3. Main findings (matches report, slides and conclusion)

Part 1 - what we looked at

- **Cookies** - small files on the device
- **Third-party requests** - the page calling other companies (ads, fonts, analytics)
- **Countries** - KeyCDN guess from IP addresses (not a legal transfer register)

Key point: many requests does not mean many cookies.

Part 1 - the numbers that matter

- **Most requests:** fotball.no (113) - but zero third-party cookies
- **Only third-party cookies:** ikea.no (2, after redirect to ikea.com). 17 of 18 sites had zero.
- **Quietest government sites:** lanekassen.no (1 request), altinn.no (5)
- **Widest country list:** document.no (6 countries excluding Norway)
- **By sector:** news/media contacts the most; government the least
- **Repeat check:** babyshop.no rose to 101 requests on Table 3; we keep Table 2 (45) for ranking

Part 2 - ICO in plain language

- **Four purposes match:** Skatteetaten tax data, Netflix streaming, fotball.no match history, babyshop.no checkout
- **Two consent tests are Partial:** Skatteetaten optional cookies and document.no Google Signals
- **Partial means:** the notice says consent, but the ICO marks consent INCONCLUSIVE - the wording is not clear enough, not that the site is automatically unlawful

Service	Purpose we tested	Match	Plain summary
skatteetaten.no	Tax and registry data	Yes	The law requires this. Consent is not the right basis.
skatteetaten.no	Optional statistics cookies	Partial	Notice claims consent, but ICO cannot confirm it is explained clearly enough.
netflix.no	Paid streaming account	Yes	Contract fits paying for the service.
fotball.no	Match history (name + club, 13+)	Yes	Legitimate interests fits publishing match lists.

Service	Purpose we tested	Match	Plain summary
document.no	Google Signals analytics	Partial	Consent is buried in Google settings and general terms.
babyshop.no	Checkout and delivery	Yes	Purchase contract fits order data.

4. How the report is built

Report section	What is inside
Introduction	Two research questions and key terms
Table 1	18 course sites by sector
Table 1a	Five sites chosen for ICO
Part 1	Webbkoll method, KeyCDN, column definitions
Tables 2-3	First and repeat Webbkoll measurements
Figures 2-4	Bar chart, pie chart, sector totals
Table 4	Highest and lowest third-party requests
Figures 1, 5-6	klassekampen.no method example
Part 2	ICO method and one site per subsection
Table 5	ICO summary for five services
Figure 7	Skatteetaten privacy hub (two purposes split)
Conclusion	Part 1 + Part 2 findings in short form

Body text stays within 1000-1500 words. Tables and figures are diagrams and do not count toward the word limit.

5. How the presentation is built (17 slides)

Slide	Title / content
1	Title + two research questions + authors
2	Two questions - Part 1 Webbkoll vs Part 2 ICO
3	How we measured (Webbkoll + KeyCDN note)

Slide	Title / content
4	What we looked at and key findings (split layout)
5	Table 4 - highest and lowest requests
6	Figures 2-4 - charts by site and sector
7	klassekampen.no example
8	ICO: one purpose at a time
9	Table 5 - ICO vs notice
10	Four match, two consent tests Partial (plain explanation)
11	skatteetaten.no - tax vs optional cookies
12	netflix.no - paid streaming
13	fotball.no - match history
14	document.no - Google Signals
15	babyshop.no - checkout
16	What the report shows (four-sentence close)
17	Questions

6. Files to use

File	Use it for
ACIT4280_1A_report.pdf	Upload to Canvas
ACIT4280_1A_presentation.pptx	Present in class (or upload if required)
ACIT4280_1A_presentation.pdf	Backup if PowerPoint fails
figures/	All report and slide images
Six ICO .docx files	Evidence for Part 2 (keep with the project, attach if asked)

ICO_5sites_worksheet.html and oppgave-1a-ico-svar.md are working notes only - not for Canvas.

7. If someone asks a quick question

Why does fotball.no rank highest but have no cookies? Because Webbkoll counts requests (calls to other hosts), not cookies. They are separate.

What does Partial mean? The notice points to consent, but the ICO tool cannot mark consent as valid for that purpose - usually because the wording is too vague or hidden.

Is Skatteetaten illegal? No. Tax data looks lawful. Only the optional cookie consent wording is uncertain in the ICO test.

Why two Skatteetaten rows? Tax data and optional cookies are two different purposes and need two ICO runs.
